

AIRLAY RECTANGULAR ATTENUATORS

AirLay rectangular attenuator

AirLay splitter section

DESCRIPTION

The patented AirLay range of rectangular attenuators achieves superior noise reduction in commercial HVAC applications. Its revolutionary polyester acoustic infill provides greater insertion losses across the most critical frequencies when compared to conventional infill materials. This high performance infill is made from 70% recycled plastic and features a hardened outer membrane which reduces the potential for insulation fibres to enter the airstream.

Standard lengths available from 600 to 3000mm or manufactured to individual requirements.

Features

- Engineered design to reduce the overall weight and improve performance.
- Patented design including AirLay polyester acoustic infill that provides greater insertion losses across the most critical frequencies.
- Infill features a hardened outer membrane to reduce the potential for insulation fibres to enter the airstream.
- Straight splitters will provide higher noise reductions.
- Tapered splitters will give lower pressure drops.

Typical Applications

Used in general HVAC applications where high insertion losses are required. This range is suitable for temperatures up to 80 °C and for dry applications. For applications where water may be present in the air stream or where insulation must be encapsulated refer to the Q-Seal attenuator series (page H4).

CONSTRUCTION

- Casing and splitter frames made from Z275 coated galvanised sheet metal as standard or stainless steel as a special order.
- Polyester acoustic infill is made from 70% recycled plastic with a hardened membrane facing.
- Standard construction rated to duct pressures between -500Pa and +1000Pa relative to atmosphere.
- Casing includes Pittsburg corner seams.

SECTIONAL SIZING AND JOINING FLANGE INFORMATION

- 35mm TDF flanges as standard or 40mm/50mm steel angle section frames may be provided on request.
- Rectangular attenuators will typically be made in a single piece up to a maximum of 2400mm in width, length or height. Above this dimension attenuators will be split into multiple sections in the dimension(s) exceeding the 2400mm limit noted.
- As a special request, attenuators may be divided into smaller sized sections than standard to fit through small spaces, before they are reassembled as a single unit on site.

CUSTOMISED ATTENUATOR OPTIONS

The following are available as special options when ordering Fantech's AirLay Rectangular Attenuators:

- Different materials of construction such as Stainless Steel Grades 304 and 316.
- Paints / protective coatings such as epoxy paint, Chlorinated Rubber etc.
- Flange material/dimensions profile can be specified e.g. Ductmate, TDF, Plain Steel Angle.

INSERTION LOSS

The values quoted in the tables are defined as static insertion loss as defined in BS4718:1971*, Methods of Test for Attenuators for Air Distribution System. Insertion losses greater than 50dB are not reported as their achievement in practice is difficult.

SUGGESTED SPECIFICATION

Rectangular attenuators shall be of the AirLay Series as designed and manufactured by Fantech Pty. Ltd. and shall have the dimensions, insertion losses and pressure losses as scheduled. Insertion Loss data for the attenuators will be derived from tests in accordance to BS4718:1971.

The casing shall be manufactured from Z275 coated galvanised sheet metal with Pittsburgh corner seams.

The acoustic infill shall be polyester made from 70% recycled material and will have a hardened outer membrane to reduce the potential for insulation fibres entering the airstream.

AIRLAY RECTANGULAR ATTENUATORS

HOW TO ORDER

DIMENSIONS

SELECTION PROCEDURE & PRESSURE DROP CALCULATION

Attenuators with small percentages of free area and longer length will provide the greatest attenuation but also the greatest pressure loss. Certain steps within the attenuator selection process may therefore need to be repeated a number of times in order to determine the best selection within these constraints.

The Fantech Selection Program can be used to quickly create multiple selection options or alternatively the following manual process can be used.

Step 1: Insertion Loss - From the performance data table select an attenuator that provides an insertion loss closest to that of the required insertion loss.

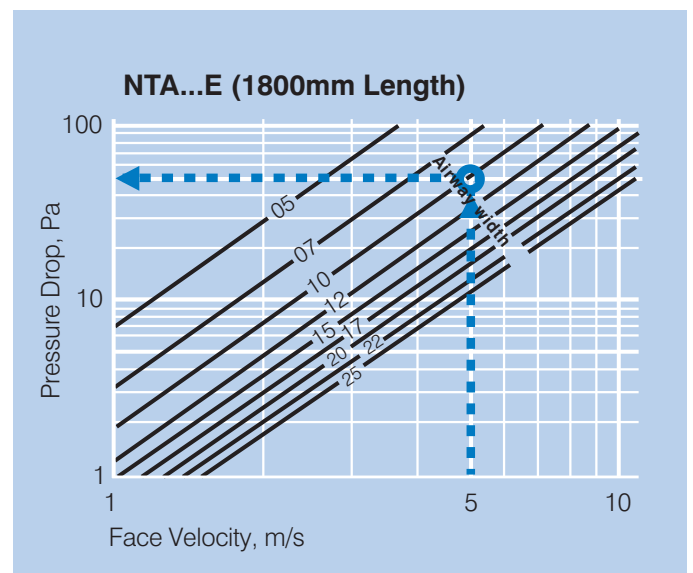

Step 2: Dimensions - Considering the dimensional constraints of the connecting duct work or installation location, select the most suitable set module width for the attenuator chosen in step one and nominate the required height (unrestricted).

Step 3: Face Velocity - Calculate the face velocity of the attenuator selected using the known air volume of the application and chosen width and height:

$$\text{Face Velocity (m/s)} = \frac{\text{Air Volume (m}^3\text{/s)}}{\text{Width (m) x Height (m)}}$$

Step 4: Pressure Drop Graphs - Locate the pressure drop graph which matches the length of the attenuator selection. Draw a line vertically from the calculated Face Velocity to where it intersects the chosen attenuator model. Draw a line horizontally from this point and where it intersects the vertical axis is the pressure drop for the chosen attenuator.

Example: A NTA10E attenuator with a calculated face velocity of 5m/s has been selected. The resulting pressure drop is 50Pa.

AIRLAY RECTANGULAR ATTENUATORS

PRESSURE LOSS GRAPHS – NSA ATTENUATOR, STRAIGHT SPLITTERS

AIRLAY RECTANGULAR ATTENUATORS

HOW TO DETERMINE WEIGHT

Attenuator weights for individual models are available on the Fantech Selection Program or alternatively the following manual process can be used to attain the approximate maximum weight of each attenuator combination.

Divide the chosen attenuator width by the chosen module width to get the quantity of modules within the attenuator. Round up to the length and height row closest to the attenuator selected, and then the column with corresponding module quantity will provide the maximum weight of the selection. Interpolate for intermediate sizes as required.
